

Penguins

There are seventeen different types of penguin in the world. Penguins can't fly. Penguins have webbed feet. Penguins eat fish, shellfish and squid. In my report I will be talking about four different penguins: The Humboldt Penguin. Humbolt penguins weigh between 3.5 kg and 6 kg and are 56-70 cm tall. There are 13 Humbolt penguins in Dublin Zoo. The Humbolt penguin can dive down to about 200 metres and drinks sea water.

The Emperor Penguin: The Emperor penguin is the biggest penguin. It lives in Antarctica. The Emperor penguin is able to survive temperatures that are 60 degrees below freezing point. When its really cold the males huddle

Penguins

together to protect the eggs.

The Little Penguin: The little penguin is the smallest penguin. It is 33cm tall. The little penguin is in Australia, New Zealand and Chile. The little penguin are very good swimmers.

The Galápagos Penguin: In 1982, the weather changed and three quarters of this type of penguin died. The Galápagos penguin lives on the Galápagos islands.

My favourite penguin is the little penguin.
